*Institutional quality and international holdings
composition in the EMU*

Roberta De Santis and Tatiana Cesaroni

Department of the Treasury
Economic and Financial Research Division
Rome, 23rd September 2016

Motivation (i)

- This paper studies the effects of financial integration and institutional quality on international holdings composition in the EMU countries over the period 1986-2014.
- It analyzes the dynamics of three main components namely, foreign direct investments, portfolio debt investments, and portfolio equity investments.
- The composition of international holdings plays an important role in determining vulnerabilities, likelihood of crises, resilience, economic performance and also..... in assessing the “endogeneity hps” for the EMU”.

Motivation (ii): is EMU a self-fulfilling prophecy?

- "*Is EMU more justifiable ex post than ex ante?*" "yes" in Frankel and Rose (1998) *ex ante* analysis.
- Our *ex post* examinations suggest that the hps does not hold.
- The EMU periphery has not performed as well as predicted by the endogeneity hps
 - i) Caporale G., De Santis R. and A. Girardi (2015) "*Trade intensity and output synchronization: The endogeneity properties of EMU*", Journal of Financial Stability.
 - ii) Cesaroni T. and De Santis R. (2016), "*Current account "core periphery dualism" in the EMU*", The World Economy.

Motivation (iii)

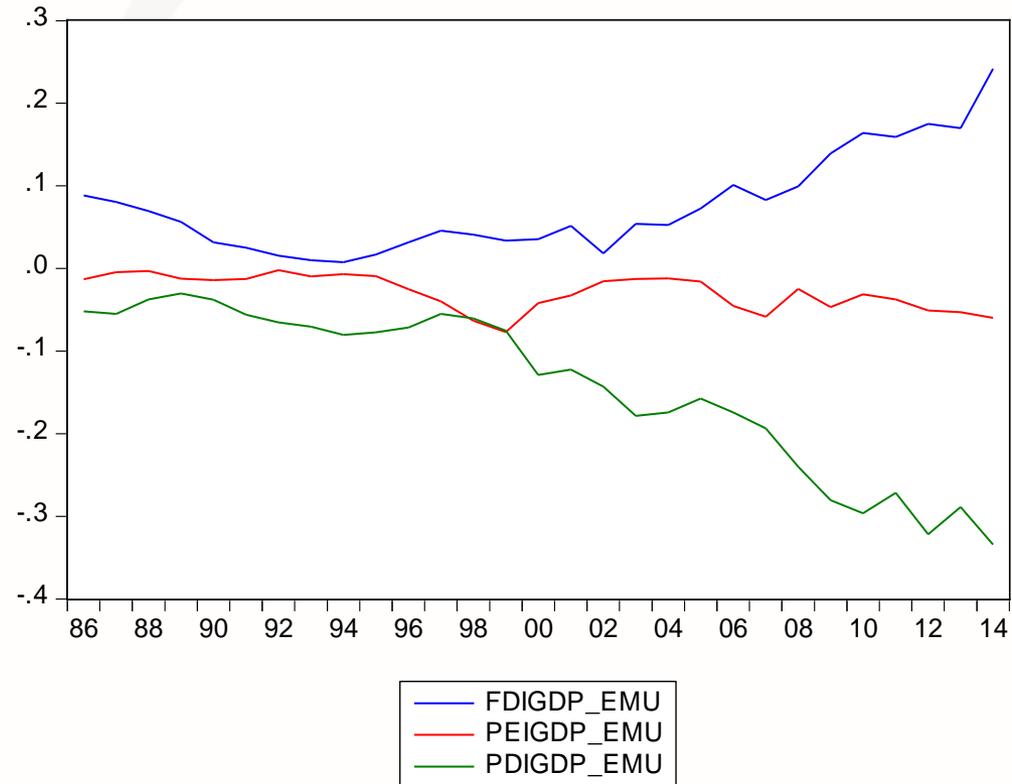

- The literature ranks international transactions, in increasing order of riskiness and decreasing order of economic performance: FDIs, portfolio equity and debt investments (Furceri et al 2011).
- The equity-debt mix is strictly related to country economic characteristics and financial regulatory settings.
- Economies with better institutional quality have a greater share of portfolio equity and FDI in external liabilities (Faria et al 2007).
- Institutions have a distinctive role in supporting economic performance and attracting foreign capitals (Acemoglu et al. 2012; Rodrik, 2008).

Contribution to the existing literature

- Our contribution to the existing literature is threefold:
 - i) we analyze the determinants of international holdings composition in the EMU countries with a focus on core and peripheral members;
 - ii) we examine the evolution of the international holdings composition for a long period (1986-2014) catching the effects of various structural changes;
 - iii) we analyze specifically the role played by institutional quality.

Descriptive statistics(i): PEIs , PDIs, FDIs trends in EMU (1986-2014)

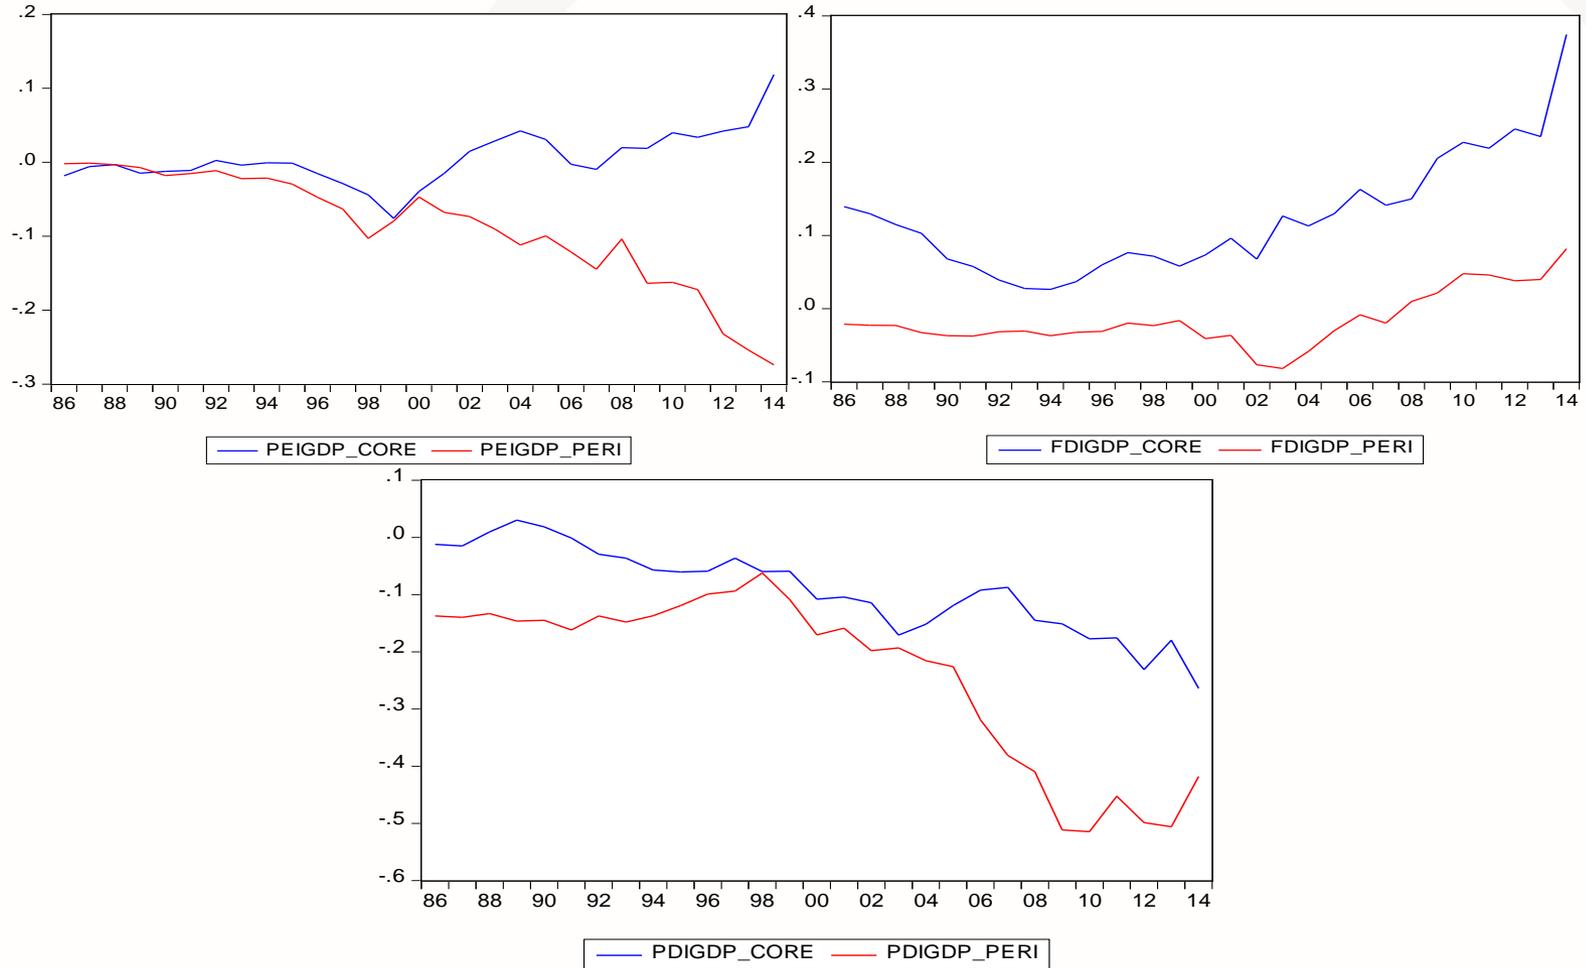

Chart 1 Net stocks of FDI, PDI, PEI in the EMU countries.

Source: EWN (2015)

Descriptive statistics(ii): PEIs , PDIs, FDIs trends in core and periphery (1986-2014)

Chart 2 Net stocks of FDI, PDI, PEI in the core and periphery EMU countries

Source: EWN (2015)

Descriptive statistics(iii): PEIs , PDIs, FDIs trends in core and periphery (1986-2014)

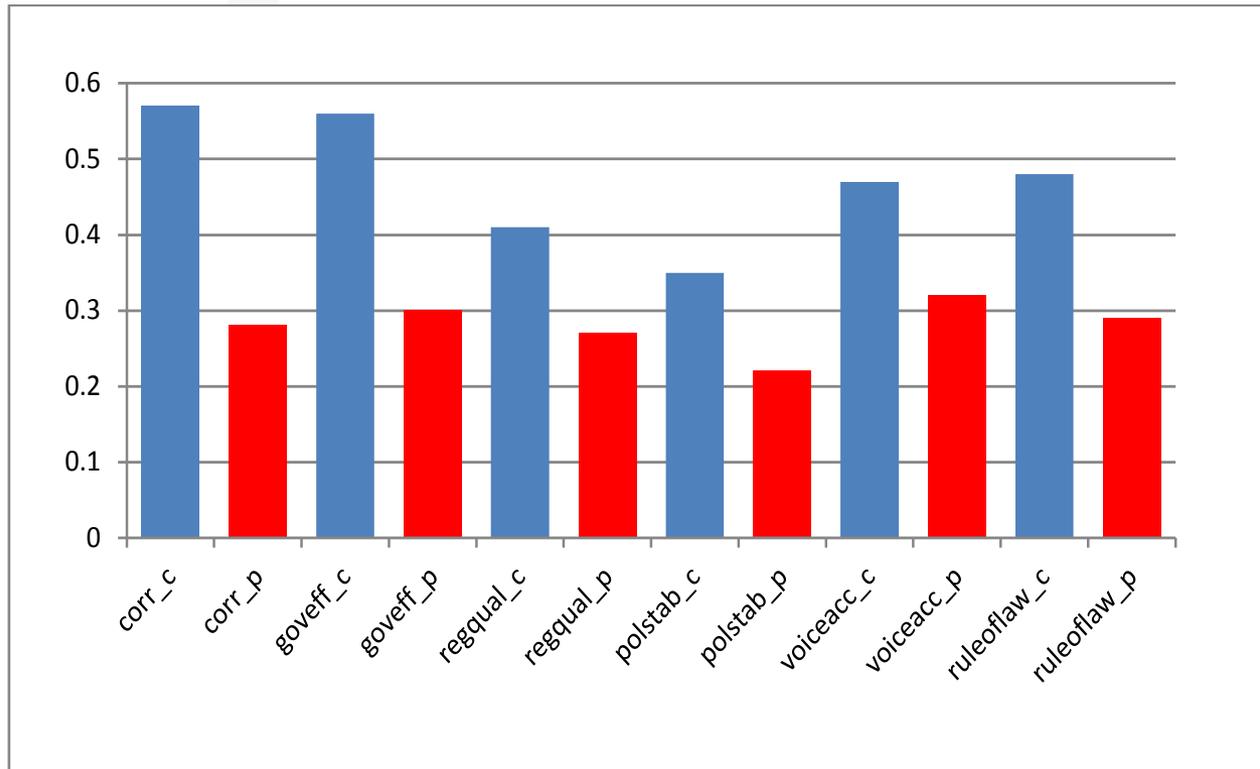

Finding 1: After the euro introduction net PEIs displayed asymmetric trends for core (increasing) and peripheral (decreasing) countries.

Finding 2: After the euro introduction net FDIs displayed a growing trend for core countries and a substantial stability for peripheral countries.

Finding 3: After the euro introduction net PDIs displayed a sharp decreasing trend for peripheral countries.

Descriptive statistics(iv)

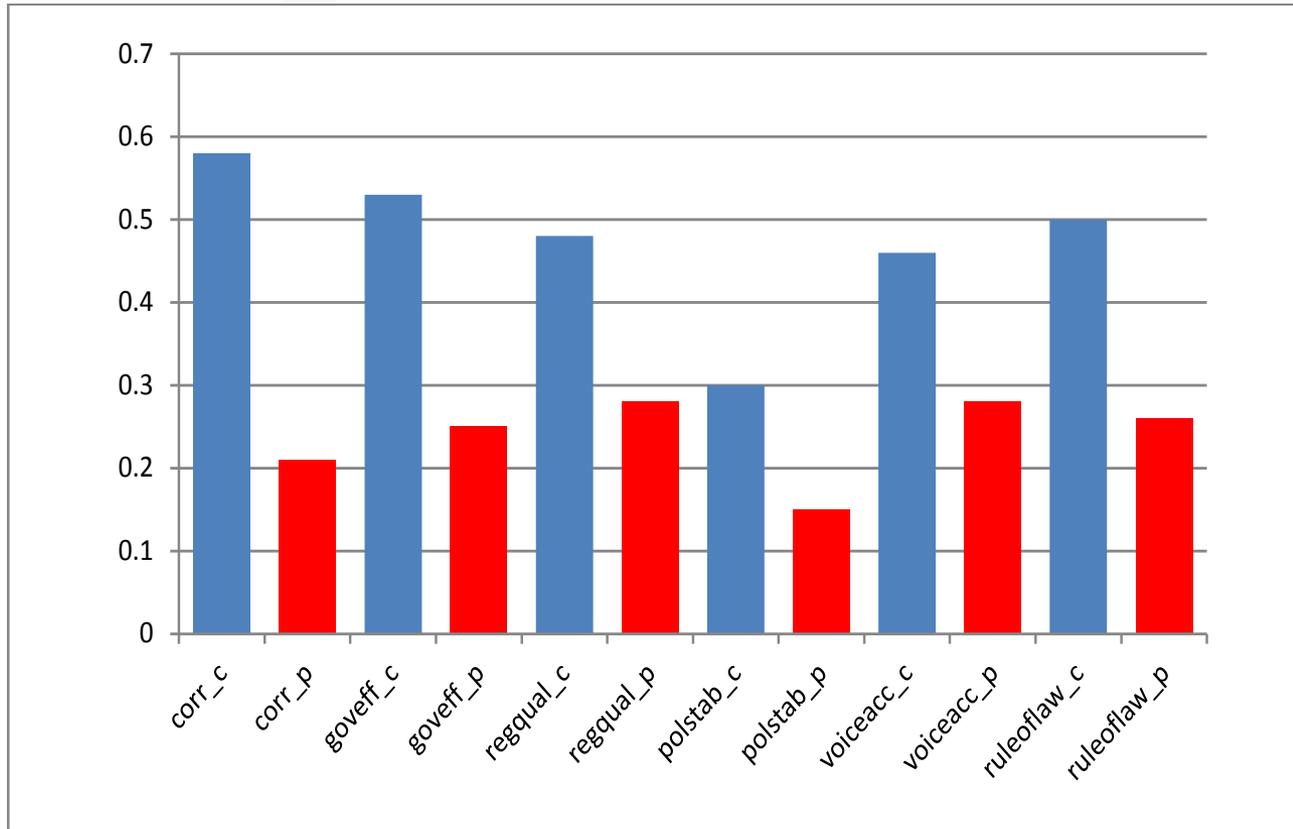

Chart 3 Institutional quality in core and peripheral countries (average 1986-1999)

Source: World bank WGI

Descriptive statistics(v)

Chart4 Institutional quality in core and peripheral countries (average 2000-2014)

Source: Word bank WGI

Descriptive statistics(vi)

Finding 4 The institutional quality, on average, has been higher in core countries than in peripheral ones.

Finding 5 The distance between institutional quality scores in core and peripheral countries, on average, has widened after the euro introduction.

Dataset

- We consider 20 OECD members and a subsample of 14 EU countries (11 EMU members).
- We split the EMU countries into two sub-groups: core (Germany, Austria, the Netherlands, Belgium, Finland and France) and periphery (Italy, Spain, Portugal, Ireland and Greece).
- The data come from different sources: OECD, Milesi Ferretti (2015) and World Bank.
- The time sample spans from 1986 to 2014.

Empirical strategy (i)

- We use a dynamic panel data estimator because the statistical properties of the series show that the international holdings stocks are affected by marked persistence effects.
- The estimated dynamic equations are the following:

$$PEIshare_{it} = \beta_i + \beta_{01} * PEIshare_{it-1} + \beta_1 * X_{it} + \beta_2 * Y_{it} + \beta_{35} * Z_{it} \quad [1]$$

$$PDIshare_{it} = \beta_i + \beta_{01} * PDIshare_{it-1} + \beta_1 * X_{it} + \beta_2 * Y_{it} + \beta_{35} * Z_{it} \quad [2]$$

$$FDIshare_{it} = \beta_i + \beta_{01} * FDIshare_{it-1} + \beta_1 * X_{it} + \beta_2 * Y_{it} + \beta_{35} * Z_{it} \quad [3]$$

- where, the dependent variable, $PEI (PDI, FDI)share_{it}$ is the ratio of country's net PEIs stock (PDIs, FDIs) to the country GDP. i and t are the country and year indices, respectively.

Empirical strategy (ii)

- We follow the “pull and push factors approach” (Montiel and Reinhart, 1999): pull factors are domestic factors in the recipient country and push factors are external/global factors.
- X is a vector, including common pull factors: financial integration, institutional quality and push factors: US three month T- bill rate, Brent .
- Y is a vector of FDIs specific determinants including the market size, trade openness and real effective exchange rate.
- Z contains controls such as the GDP growth rate or output gap, dummies and time trends.

Preliminary estimates results (i)

Our preliminary results show:

- The sign and magnitude of the coefficients are in line with the literature (Xingwang and Steiner 2014, Furceri 2011).
- As for net PEIs, the output gap and the dummy for the crisis have a positive impact while the reduction of corruption, and financial integration seem to have displayed a negative impact.
- It seems that being a peripheral EMU country had a negative impact while the opposite occurred for the core countries.
- The sign of corruption indicator remains unchanged in the subsamples while the magnitude of its coefficient is greater in the post euro period.

Preliminary estimates results (ii)

- As for PDIs:
 - i) financial integration had a positive impact and the crisis a negative one;
 - ii) to be core had a negative impact in the three subsamples, to be peripheral had a negative and significant impact only after 1999.

- As for the FDIs:
 - i) corruption control, financial integration, the crisis and to be core or peripheral EMU members had a positive and significant impact in the three subsamples.
 - ii) The degree of trade openness, the real effective exchange rate and the output gap had a negative impact.

Preliminary estimates results (iii): instit. quality in core and peripheral countries

- PEIs:
 - i) in core countries the control of corruption had a negative impact while the improvement in regulatory quality a positive one;
 - ii) in peripheral countries institutional quality had a negative impact and the magnitude of the coefficients is greater than that of core countries.
- PDIs:
 - i) in core countries institutional quality had a negative impact,
 - ii) in peripheral countries with few exception the coefficients are not significant (moral hazard?).
- FDIs:
 - i) in core countries institutional quality stimulates investments abroad,
 - ii) in peripheral countries the impact was heterogeneous.

Conclusions

- The EMU core and periphery have performed differently especially after the 1999: not in favour of the endogeneity hypothesis.
- The heterogeneity in institutional quality might have amplified the asymmetric behavior between core and peripheral members in terms of international holdings composition.
- These findings have important policy implications concerning the role of international capital movements and institutional quality.
- The preliminary evidences suggest that an improvement of the institutional quality might restrain the heterogeneous economic performances of countries within the EMU.

Thank you
